

Assignment 3

7. What is the problem? Why? (hint: how many categories in the DV?)

I would say that the biggest issues are just having to independently use the DV for each new graph. There isn't a simple solution in order to gather the data and it needs to be micromanaged.

8. What can be done to improve prediction of the dependent variable

There would be more clear defined structures within the dataset so that it is more accessible to anyone and that can be clearly understood.
